

Easy-to-Miss Detail was the Key to Stopping This Slowdown

Traditional monitoring tools would have missed this!

A financial industry powerhouse trusts Visual One to keep infrastructure performance optimized. Because Visual One prioritizes predictive analysis over traditional real-time data, this company found and resolved a slowdown they otherwise would have missed.

1

A NEEDLE IN THE HAYSTACK

In a sea of enterprise data, finding the changes that matter is like looking for a needle in a haystack. So when the latency of two Tintri devices shrank a mere 4 ms lower than their other Tintri devices, no one could have noticed.

2

ACCUMULATION OF ERRORS

Although a “minor” latency differential might not *always* have operational impact, it *can*. Plus, it can pair with other “small” errors and events to form an accumulation of errors – a silent but deadly path to an outage.

3

SUB-DIAGNOSTIC VISIBILITY

Most monitoring tools don’t notice or care about sub-diagnostic details like this. And if they did, it would be minimized as unimportant – lost in alert fatigue. Fortunately for this company, Visual One’s *best practice scanner* looks for these indicators and identified a surprising slowdown risk.

4

OUTSIZED IMPACT

Once alerted, the team took action. By shrinking the 4 ms latency difference to 1 ms, the company saved 60% of the time being used by these devices – an outsized performance impact. Moreover, by fixing this they also removed a risk-factor for a future outage – breaking the accumulation of errors that can easily develop.
